**ZAIRE** – 2000

1550	50f on 35000z	<i>Termitomyces aurantiacus</i>	Amanitaceae
------	---------------	---------------------------------	-------------

And a correction:

Received a note from Zdenek Moravec in Czechoslovakia, a member of the Czech Topical Society. In this note Mr. Moravec notes that in Biophilately 52(3): 115 I had shown “No listing in my Ainsworth & Bisby (7<sup>th</sup>)” for the family associated with *Cryptotrama asprata*. Ah well... I was right and wrong at the same time, as he gently points out. Indeed there is no family name associated with *Cryptotrama*; however, if I had spelled the genus correctly I would have found that *Cyptotrama* Singer (1960) is in the family Tricholomataceae. So, for those of you who try to keep these things straight – correct the name of the genus and add the appropriate family name to the citation. And, thanks Mr. Moravec for the correction.
